

In this part of the documentation, we are going to show you how you can customize.

Colors:

<

To customize colors all you have to do is to navigate from project root to /assets/scss/_variables.scss file and add the custom color values inside the color key. This way you can add custom colors for your project.

```
> cards
                                                 $dark: □#1A2142;
> acarousel
                                                 $dark-2: #2f3546;
> 🣭 chat
                                                 $dark-3: □#090e34;
> tall clients
                                                 $dark-4: □#262d3f;
> adashboards
file-manager
                                                 // ====== gray color
> III forms
                                                 $gray: □#5d657b
                                                 $gray-2: □#c2cbd6
                                                 $gray-3: □#8F9AAD
> invoice
kanban
                                                 $sidebar-text: ■#9AA4CA;
> 🔚 layout
> modals
                                                 $primary: □#365CF5;
> notification
pagination
pricing
                                                 $secondary: #00c1f8
> progressbar
                                                 $success: □#219653;
> x projects
> 📑 settings
                                                 $success-2: □#10B981
                                                 $success-light: □#42d29d
> matables
> 🖿 tabs
                                                 $danger: #d50100;
> III typography
                                                 $danger-2: #FB5454;
  _common.scss
                                                 $danger-light: ■#fa5a78
    _default.scss
  _mixin.scss
                                                 // ====== warning color
